No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 1, P

Sequence 5, Application US/09457568

Patent No. 6413943

GENERAL INFORMATION:
APPLICANT: GALTHUR. James G
APPLICANT: Gyuris, Jeno
APPLICANT: Gyuris, Jeno
APPLICANT: Finer, Mitchell H
TITLE OF INVENTION: Methods and Reagents for Inhibiting Proliferation of
FILE REFERENCE: 106:82.691

CURRENT APPLICATION NUMBER: US/09/457,568

CURRENT FILING DATE: 1999-12-09

EARLIER APPLICATION NUMBER: 60/122,974

EARLIER PILING DATE: 1999-11-05

EARLIER FILING DATE: 1999-11-05
                                                                                                                                                                                                                                                                                          Sequence 5, Application US/09457646

Patent No. 6420345

GENERAL INFORMATION:

APPLICANT: Patel, Salil D

APPLICANT: MCArthur, James G

APPLICANT: Gyuris, Jeno

TITLE OF INVENTION: Methods and Reagents for Inhibiting Proliferation of

TITLE OF INVENTION: Methods and Reagents

FILE REFERENCE: 106482.287
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1098

The present sequence encodes a 27 kDa protein (p27 or KipI) which inhibits the activation of a cyclin E-cyclin-dependent kinase2 (Cdk2) complex. A reduced relative level of kipI is indicative of a hyperproliferative disease (particularly cancer, especially breast carcinoma) and also is prognostic for increased risk of death and/or recurrence of cancer (and may be used to determine suitable treatments). Agents that affect the activity of kipI can be used to treat hyperproliferative conditions, e.g. to stimulate tissue or organ repair or to establish cell cultures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E7 oncoprotein; proliferative state; HPV; kinase activity; cyclin/cyclin-dependent kinase; p21CIP1; interaction; inactivation; cyclin/cyclin-dependent kinase inhibitor; ss.

                                                                                                                                                                                                                                                                                                                                      A cDNA clone (AAT16336) codes for a 27 kDa protein, p27 Kipl (AAR92709), that is capable of binding to and inhibiting the activation of a cyclin E-CACA complex. The Kipl cDNA was obtd. by PCR amplification of a lambd gtll cDNA library prepd. from human kidney cells, using primers (see also AAT16337-46) based on isolated tryptic peptides (AAR92710-14) of mink Kipl. Mink (AAT16334) and mouse (AAT16335) Kipl cDNAs were also obtd. The cDNA clones can be incorporated into a vector and used for prodn. of recombinant Kipl proteins in transformed host cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a p27KIP1 protein, which is part of a family of small cyclin-dependent kinase inhibitors. The proliferative state of a cell transformed with Human papillomavirus (HPV) can be evaluated in the following manner. Cyclin/cyclin-dependent kinase complexes containing protein p27KIP1 are isolated from the transformed cell, and the HPV E7 oncoprotein (AAW46886) added to the isolated promed protein. Cyclin/cyclin-dependent kinase complexes are isolated from an untransformed cell that is substantially homogenic with the transformed cell, and the HPV E7 oncoprotein added. The kinase activities of the 2 samples are measured, where a proliferating transformed cell has a greater kinase activity that the untransformed cell. The method is used for determining the extent of interaction and/or inactivation between a cyclin/cyclin-dependent kinase inhibitor and the HPV E7 oncoprotein and thus evaluating the proliferative state of a transformed cell
                                                                                                                                                                                                                                                                                                                                                                                                                            Evaluation of proliferative state of cells transformed with human papilloma virus - by determining cyclin-dependent kinase activity induced by E7 onco-protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CKI/KIP protein; p27 protein; cyclin kinase inhibitor; cancer; hyperproliferative disorder; ds.

This sequence encodes the cyclin kinase inhibitor (CKI) protein p27. The invention relates to a method for diagnosing a hyperproliferative disorder, associated with the destabilisation of a CKI protein in cells of a patient, comprises: (i) ascertaining the CKI protein level in a sample of patient, comprises: (i) ascertaining the CKI protein level in a semple of patient cells; and (ii) diagnosing the presence or absence of a hyperproliferative disorder by utilising the ascertained CKI protein level, where a reduced CKI protein level, relative to a normal control cell sample, correlates with the presence of a hyperproliferative callsomple, correlates with the presence of a hyperproliferation, evaluating their aggressiveness and/or rate of recurrence and as prognosis for evaluating a cancer patient's risk of cath. From the observations, treatment can be applied on the basis of the patient's risk of death and/or recurrence of the cancer. The diagnostic methods may also be employed as follow-up to treatment, e.g. quantitation of the level of p27 protein may be indicative of the effectiveness of current or previously employed cancer therapies as well as the effect of these therapies upon patient prognosis. The methods and cangents allow the detection of loss of p27 protein from a cell in order to diagnose and phenotype proliferative disorders arising from transformation of cells, or other hyperplastic or neoplastic transformation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Methods for diagnosis and prognosis of hyperproliferative disorders - by determining the level of cyclin kinase inhibitor protein(s), particularly p27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; chimeric cyclin dependent kinase inhibitor; CDKi; therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 597 BP; 161 A; 164 C; 185 G; 87 T; 0 other;

The invention relates to a protein composition comprising a novel purified chimeric cyclin dependent kinase inhibitor (CDK1) and a purified adenovirus E4 protein. The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to synchronise cell growth in cultured cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 594

```
The present sequence is that of DNA encoding human p27 (see AAY96052), a cyclin dependent kinase inhibitor (CDK1) that inhibits smooth muscle cell proliferation. A claimed method for inhibiting smooth muscle cell hyperproliferation involves transducing smooth muscle cells with a replication-deficient recombinant adenovirus that lacks a functional El region and a functional Es region, and comprises a transgene encoding a CDK1. The CDK1 is selected from an INK4 family protein such as human p16, a CIP/KIP family protein such as p27, active fragments of these, or fusion protein and a CIP/KIP family protein (active fragments of) an INK4 family protein and a CIP/KIP family protein (active fragments of) an INK4 family protein (active fragments) and active fragment placement or vein engrafument. It is useful for treating vascular pathologies e.g., restenosis. Also claimed are recombinant lentiviruses encoding
Novel recombinant lentivirus for inhibiting proliferation of smooth muscle cells in e.g. restenosis, is replication deficient and comprises a transgene encoding a cyclin dependent kinase inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cyclin dependent kinase inhibitor; CDKi; KIP; human; p27; anglogenesis; inhibitor; neoplasia; rheumatoid arthritis; endometriosis; psoriasis; vascular retinopathy; cytostatic; antlarthritic; antlrheumatic; gynascological; antipsoriatic; antiproliferative; gene therapy; ss.

Cyclin-dependent kinase inhibitor; CKI; p27; human; mutant; G1 phase; KIS; serine/threonine kinase; cell proliferation; modulator; treatment; cell proliferative disease; vascular disorder; gene therapy; restenosis;
                                                                                                                                                   The present sequence is that of DNA encoding human p27 (see AAY96066), a cyclin dependent kinase inhibition (CDKi) that inhibits angiogenesis. A claimed method for inhibiting angiogenesis involves transducing an epithelial cell with a transgene encoding (internalizable, secretable) CDK1. The delivery system for the transgene may be a liposome or a recombinant virus. The CDK1 is a protein of the CIP/KIP family such as p27, a protein of the cIP/KIP family such as p27, a protein of the cip/KIP family such as p27 and p16 (see AAY9608 80).

INK4 family such as p16, active fragments of these proteins (e.g. amino acids 25-93 or 12-178 of human p27), or a fusion protein comprising 2 CDK1 proteins such as p27 and p16 (see AAY9608 80).

The method is useful in treating conditions associated with anglogenesis, e.g. neoplasia, rheumatoid arthritis, endometriosis, psoriasis and vascular retinopathy (claimed). Alternatively, the transgene is delivered to an auxiliary cell, and is expressed by chat cell such that the CDK1 is released into the blood and contacts the target epithelial cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ser to Ala
                             Inhibiting angiogenesis and treating angiogenesis-associated conditions, e.g. neoplasia, psoriasis by transducing an endothelial cell with a recombinant virus having a transgene encoding a cyclin

The present DNA sequence encodes a mutant cyclin-dependent kinase inhibitor (CKI), p27. It is bound by hKIS, a serine/threonine kinase, that inhibits its ability to arrest cells in GI phase. A substitution mutation (AGC to GCT) results in a serine to alanine (SIOA) change in the protein, that abolishes phosphorylation of GST-p27, without affecting in vitro binding with hKIS. Endogenous p27 was detected in the cytoplasm and at higher levels in the nucleus. hKIS functions as an inhibitory kinase of CKI p27. The hKIS sequences are used to modulate cell kinase of CKI p27. The approximation and vascular diseases. The polynucleotide sequence may be used in gene therapy to treat vascular disorders such as restenosis or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 p27(Kipl) kinase inhibitor protein; FKBP-12; p27(Kipl).FKBP-12 complex; cytosolic drug-binding protein; yeast two hybrid assay system; cell differentiation; apoptosis; neurodegeneration; tumoriganicity; cell proliferation; related disorder; atherosclerosis; autoimmune disease; transplant rejection; inflammation; allergy; cancer; viral infection; membranous nephropathy; ds.

The nucleic acid sequence encoding the proteins of the complex are used to modulate the functions of the complex and exert a therapeutic effect. This is used in requisiting many cell functions, e.g. cell cycle progression, differentiation, apoptosis, neurodegeneration, response to viral infection, tumorigenicity, p27(Kip1).FKBP-12 complex and its corresponding nucleic acid sequence is used in diagnosis and treatment of cell proliferation related disorders. Specified diseases are atherosclerosis; autoimmune diseases (e.g. transplant rejection,

specification describes a knockout mouse whose genome is manipulated to comprise a homozygous disruption of both the p19 INK4d and p27 KIP1 genes, where homozygous disruption of these genes results in the knockout mouse exhibiting bradykinesia and/or proprioceptive abnormalities, or prevents in the expression of functional p19 INK4d and p27 KIP1 proteins. The knockout mouse and cells may be used to identify potential modulator of cell growth and more particularly neuronal growth. The knockout mouse is useful as animal model for studying motor disorders having symptoms that include bradykinesia and/or proprioceptive abnormalities and/or seizures, and in identifying potential modulators of motor functions. Cells from the knockout mouse may be used as a potential source of differentiated neuronal cells, and for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S-phase kinase associated protein; SKP1; SKP2; SKP2-like protein; 2F; CUL-1; cullin; CDC53; p27; cyclin E; Max; Mad; c-Myc; MDM2; p53; Bax; Bad; Bc1-2; tumour; cytostatic; ds.
The present sequence encodes a human p27 KIP1 polypeptide. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to methods of altering the polypeptide levels in a cell, using proteins selected from S-phase kinase associated proteins 1 and 2 (SKPI, SKP2), SKP2-like proteins (EP) and CUL-1 (a member of the cullin, CDC53 family of proteins). The method is useful for altering the level of p27, cyclin E, Max, Mad, c-Myc, MDM2, p53, Bax, Bad or Bcl-2 polypeptide in a cell. SKP2 and SKP2-like protein levels are useful for detecting tumours, and in monitoring tumor treatment in a mammal. Agents that modulate interactions between SKP and target proteins are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytostatic; vasotropic; tranquiliser; antiatherosclerotic; gene therapy
                                                                                                                                                                                                             Modulating polypeptide levels in a cell, diagnosing and treating tumor, involves altering levels of proteins such as S-phase kinase associated proteins 1, 2 and cullin/CDC53 proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antiinflammatory; vulnerary; gynecological; ophthalmological; vaccine; hypoxia; tumourigenesis; angiogenesis; apoptosis; cancer; ischaemic condition; reperfusion injury; retinopathy; neonatal stress; preeclapmsia; atherosclerosis; inflammatory condition; wound healing; inflammation; erythropoiesis; hair loss; human; gene; ds.

The present invertion relates to methods for identifying genes and proteins that are implicated in a specific disease or physiological condition. The method comprises comparing the transcriptome/protecome of a specialised cell type implicated in a disease or condition with that of a second specialised cell type inder two experimental conditions, and identifying a gene that is differentially regulated in the two specialised cell types under experimental conditions. ABV77873-ABV78116 and ABP65061-ABP6557 were identified using the methods of the invention. The coding sequences and proteins are useful for treating a disease in a patient, for manufacture of a medicament for treating hypoxia-regulated conditions, and for regulating tumourigenesis, angiogenesis, apoptosis, biological response to hypoxia conditions, or hypoxic-associated pathology in a patient. The coding sequences and proteins are also useful cor monitoring the therapeutic treatment of a disease or physiological condition, such as cancer, ischemic conditions, reperfusion injury, retinopathy, neonatal stress, preeclapmisia, atherosclerosis, inflammatory conditions, wound healing, inflammation, erythropoiesis or hair loss.
                                                                                                                                              Identifying a gene involved in disease for treating hypoxia-regulated conditions, comprises comparing the transcriptome/protecome of two cell types under different conditions and identifying a differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 AsnAlaGlySerValGluTrpThrProLysLysProGlyLeuArgArgGlnThr 20

```
The sequences given in AAI72395-401 encode cell cycle inhibitors.
These nucleic acids may be hybridised by antisense molecules in the method of the invention. The method is for stimulating the formation of an inner ear support cell and involves damaging a first inner ear sensory hair cell under conditions that promote the formation of at least one inner ear sensory hair cell.

The method is useful for stimulating the formation of inner ear cells calls e.g. sensory hair cells and support cells, for improving an auditory function in an inner ear, in the treatment of hearing disorder e.g. sensory neuronal hearing loss (SNHL), to identify genes and/or proteins that are capable of stimulating the formation of inner ear sensory hair cells and/or the formation of inner ear support cells from sensory hair cells. The method damages and/or the inner ear support cells from sensory hair cells and support cells and support cells, which results in the increased stimulation in the formation of new, inner ear function.
                                                                                                                                                                                                         Stimulating the formation of inner ear sensory hair cells, useful for treating hearing disorder involves damaging first inner ear sensory hair cells and promoting the formation of new sensory hair cells from

derived from a fusion of the human p27 and p16 cDNA sequences. The chimeric polypeptides of the invention have cyclin-dependent kinase (CDK) binding motifs from at least two different proteins that bind to CDKs. The protein controls proliferation and/or differentiation of cells.

The protein controls proliferation and/or differentiation of cells.

The protein controls proliferation and/or differentiation of cells.

Comparisors, atherosclerosis, restenosis, chronic inflammation etc. They can also treat diseases associated with de-differentiation etc. They can also treat diseases associated with de-differentiation etc. They degeneration of tissue, e.g. Alzhelmer's, Parkinson's or Huntington's diseases, gastric ulcers and autonomous diseases of the peripheral construction bair follicle cells against cyctotoxic treatments, cosmetically corpecting hair follicle cells against cyctotoxic treatments, cosmetically conferent various forms of folliculitis, and to inhibit spermatogenesis or conferents forms of folliculitis, and to inhibit spermatogenesis or cells, especially neurons intended for testing specific activity of more active inhibitors of the CDK/cyclin complex than binding motifs used the cell cycle).
                                                                                                                                                                                                                                                                                                                                                                                                                        sequence encodes a chimeric polypeptide of the invention. comprising a recombinant transfection system (A) that complexes. It provides a recombinant transfection system (A) that comprises: (1) first gene construct comprising a sequence encoding an inhibitory polypeptide containing at least one CDK-binding motif for binding and inhibiting activity of a CDK, linked to a transcription regulator functional in eukaryotic cells; (ii) second gene construct comprising a sequence encoding a polypeptide that promotes endothelialisation, and (iii) a gene delivery composition for delivering the GCs to a cell for transfection. Also provided are uncleic acids encoding a fusion protein (FP) containing: (i) a therapeutic polypeptide sequence (TP) from an intracellular process when FP enters the cell, and (ii) a transcellular polypeptide sequence (TCP) that promotes transcytosis of transcellular polypeptide sequence (TCP) that promotes transcytosis of FP. The FP consists of at least one CDK-binding motif and a TCP. See AXX66220 for detailed uses of the recombinant transfection system. The present sequence represents a CDNA encoding a human pl6p27 fusion

                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     167718

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                      (without alignments)

Title: Perfect score:

Sequence:

BLOSUM62 Gapop 10.0 , Gapext 0.5

Scoring table:

127863 Total number of hits satisfying chosen parameters:

127863 seqs, 47026705 residues

Searched:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_41:\* Database : Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Cyclin E-mediated elimination of p27 requires its interaction with the nuclear pore-associated protein mNPAP60.";
EMBO J. 19:2168-2180(2000)
I PUNCTION: INTO/P00 in G1 arrest. May mediate TGF beta-induced G1 arrest. Binds to and inhibits complexes formed by cyclin E-CDK2, cyclin A-CDK2, and cyclin D1-CDK4. Interaction with nucleoporin NUPSO is required for nuclear import and for degradation of posphorylated p27Kip1 after nuclear import.
Interacts with NUPSO.
I-SUBGNIT: Interacts with NUPSO.
I-SUBCLIULAR IOCATION: Nuclear.
ISSUBLIULAR IOCATION: Nuclear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Toyoshima H., Hunter T.; "p27, a novel inhibitor of G1 cyclin-Cdk protein kinase activity, is
                                                                 Kinase inhibitory protein p27Kipl.";
Somat. Cell Mol. Genet. 23:147-151(1997).
-!-FUNCTION: Involved in Glarest. May mediate TGF beta-induced Glarest. Binds to and inhibits complexes formed by cyclin E-CDK2, cyclin A-CDK2, and cyclin D1-CDK4. Interaction with nucleoporin NUP50 is required for nuclear import and for degradation of phosphorylated 427Kipl after nuclear import (By similarity).
-!- SUBGELLULAR LOCATION: Nuclear (By similarity).
-!- SIMILARITY: THE N-TERMINAL OF CIP1 AND KIP ARE SIMILAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polyak K., Lee M.-H., Erdjument-Bromage H., Koff A., Roberts J.M., Tempst P., Massague J.; "Cloning of p27Kip1, a cyclin-dependent kinase inhibitor and a potential mediator of extracellular antimitogenic signals.";

-!- PTM: THE PRECURSOR IS CLEAVED BY A FURIN ENDOPEPTIDASE.
-!- SIMILARITY: Belongs to peptidase family M12B.
-!- SIMILARITY: Contains 1 disintegrin-like domain.
-!- SIMILARITY: Contains 3 TSP type-1 domains.
-!- CAUTION: REF. 2 SEQUENCE DIFFERS FROM THAT SHOWN DUE TO A FRAMESHIFT IN POSITION 7.
                                                                                                                                                                                                                                                                                              "Progesterone-regulated genes in the ovulation process: ADAWTS-1 and cathepsin L proteases.";
Proc. Natl. Acad. Sci. U.S.A. 97:4689-4694(2000).
Proc. Natl. Acad. Sci. U.S.A. 97:4689-4694(2000).

I- FUNCTION: CLEAVES AGGREGAN, A CRRILAGE PROTEOGLYCAN, AND MAY BE INVOLVED IN ITS TURNOVER. HAS ANGIOGENIC INHIBITOR ACTIVITY (BY SIMILARITY). ACTIVE METALLOPROTEASE, WHICH MAY BE ASSOCIATED WITH VARIOUS INFLAMMATORY PROCESSES AS WELL AS DEVELOPMENT OF CANCER CACHEXIA. MAY PLAY A CRITICAL ROLE IN FOLLICULAR RUPTURE (BY SIMILARITY).

-! CATALYTIC ACTIVITY: Cleaves aggrecan at the 1691-Glu-|-Leu-1692 site, within the chondroitin sulfate attachment domain.
-! COPACTOR: Binds 1 zinc lon per subunit (By similarity).
-! SUBECLIULAR LOCATION: SECRETED. ASSOCIATED WITH THE EXTRACELLULAR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 INDUCTION: INDUCED IN VITRO IN COLON ADENOCARCINOMA CELLS BY INTERLEUKIN-1, OR IN VIVO IN KIDNEY AND HEART BY LIPOPOLYSACCHARIDE. ALSO INDUCED BY LH STIMULATION IN GRANULOSA
                                                                                                                                                                                                                                             MEDLINE-20243757; PubMed-10781075;

Relatively highly expressed in thymus, testis, and small intestine. Expressed at low levels in several tissues including spleen, prostate, brain, heart, ovary, colon, kidney, lung, liver and pancreas and not expressed in skeletal muscle and leukocytes. Highest but relatively low level of isoform 2 in placenta and very low level in numerous tissues including adipose tissue and many brain regions. Isoform 3 is expressed in brain and heart and, at lower levels, in kidney, liver, lung and pancreas.

SIMILARITY: BELONGS TO FAMILY 1 OF 6-PROTEIN COUPLED RECEPTORS. HIGHEST TO ORRXIN, NPY AND CHOLECYSTOKINI, RECEPTORS.
"Cloning and characterization of the NPGP receptor and identification of a novel short mRNA isoform in human hypothalamus.";
Submitted (MAY-2001) to the EMBL/GenBank/DDBJ databases.";
FUNCTION: RECEPTOR FOR NPAF (A-18-F-AMIDE) AND NPFF (F-8-F-AMIDE)
NEUROPEPTIDES, ALSO KNOWN AS MORPHINE-MODILATING PEPTIDES. CAN ALSO BE ACTIVATED BY A VARIETY OF NATURALLY OCURRING OR SYNTHETIC FMRR-AMIDE LIKE LIGANDS. THIS RECEPTOR MEDIATES ITS ACTION BY ASSOCIATION WITH G PROTEINS THAT ACTIVATE A PHOSPHATIDYLINOSITOL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      60; 60:0005887; C integral to plasma membrane; TAS.

ligases with F-box motifs (F-box proteins) are useful for diagnosis of proliferative and differentiated related disorders by measuring FBP gene expression. Cells expressing such proteins or their fragments are useful for screening compounds. The compounds are agonists or antagonists, which are useful for treating a proliferative or differentiative disorder in a mammal such as and also major opportunistic infections, immune disorders, cardiovascular diseases and inflammatory disorders. FBP protein, analogs, derivatives and their subsequences, anti-FBP antibodies are also useful in diagnosis of the disorders. This peptide corresponds to the carboxy-terminus of human p27.
                                                         Nucleic acids encoding substrate-targeting subunits of ubiquitin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                               In the inventor of differentiative disorders comprising detecting a change in the activity of Skp2 (F-box protein). The method is useful for screening compounds for the treatment of proliferative or differentiative disorders, particularly cancer. These compounds include small molecules, or compounds or derivatives or analogues of the new ublquitin ligases. The compounds are useful for treating diseases such as cancer (e.g. breast cancer, prostate cancer or ovarian cancer, lymphoma, small cell lung carcinoma or parathyroid adenomas), major opportunistic infections, immune disorders. This sequence represents the carboxy terminus of a human p27 phosphopeptide relating to the F-box proteins (FBPs) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                  compounds useful for the treatment of
                  Screening compounds for treating proliferative disorders, e.g. breast cancer or prostrate cancer, infections or immune disorders, comprises detecting a change in the activity of {\rm Skp2} with either p27 or {\rm Cks1}

The method is useful for altering the level of p27, cyclin E, Max, Mad, c-Myc, MDM2, p53, Bax, Bad or Bcl-2 polypeptide tumours, and in monitoring tumor treatment in a mammal. Agents that modulate interactions between SKP and target proteins are useful for treatment in the cell for the control for treatment in a mammal. Agents that the control of the control o
  compounds for the treatment of proliferative or differentiative
     disorders, particularly cancer. These compounds include small molecules, or compounds or derivatives or analogues of the new ubiquitin ligases. The compounds are useful for treating diseases such as cancer (e.g. breast cancer, prostate cancer or ovarian cancer, lymphoma, small cell lung carcinoma or parathyroid adenomas), major opportunistic infections, immune disorders, certain cardiovascular diseases or inflammatory disorders. This sequence represents a peptide of an F-box protein (FBP) relating to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modulating polypeptide levels in a cell, diagnosing and treating tumor, involves altering levels of proteins such as S-phase kinase associated proteins 1, 2 and cullin/CDC53 proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S-phase kinase associated protein; SKP1; SKP2; SKP2-like protein; CUL-1; cullin; CDC53; p27; cyclin E; Max; Mad; c-Myc; MDM2; p53; Bax; Bad; Bc1-2; tumour; cytostatic.

AAR79131-R79133 are respective mink, murine and human kipl (p27-kipl or p27) partial proteins. p27 inhibits the activation of the cyclin Ecd22 (cyclin dependent kinase) complex. Agents which inhibit or enhance the ability of p27 to inhibit the activation of cyclin E-Cd22, can be used to treat hyperprolliferative disorders, e.g. cancer, hyperprolliferative disorders, e.g. mutation in the cells of the patient. The disorder can be treated using a pharmaceutical compsn. comprising a recombinant virus (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel protein, p27 inhibits activation of a cyclin E-Cdk2 complex useful for treatment of hyper-proliferative disorders, e.g. cancer, hyperplasia or ulcers.
                                                                                                                                                                         Human kip1, p27-kip1 or p27, cyclin E-Cdk2 activation inhibitor.
                                                                                                                                                                                                Human kipl; p27-kipl; p27; cyclin E-Cdk2 complex; cancer;
activation inhibitor; hyperplasia; cyclin dependent kinase;
diagnosis; hyperproliferative disorder; ulcer; partial protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a 27 kDa protein (p27 or KipI) which inhibits the activation of a cyclin E-cyclin-dependent kinase2 (Gdk2) complex. A reduced relative level of kipI is indicative of a hyperproliferative disease (particularly cancer, especially breast carcinoma) and also is prognostic for increased risk of death and/or recurrence of cancer (and may be used to determine suitable treatments). Agents that affect the activity of kipI can be used to creat hyperproliferative conditions, e.g. to stimulate tissue or organ repair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           E7 oncoprotein; proliferative state; HPV; kinase activity; cyclin/cyclin-dependent kinase; p2lCIPl; interaction; inactivation; cyclin/cyclin-dependent kinase inhibitor.
                                                                                                                                                   27 kDa protein inhibiting activation of cyclin E-Cdk2 complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Assays for protein p27 inhibiting activation of cyclin E-Cdk2 complex - useful for, e.g. diagnosis and prognosis of cancer, especially breast carcinoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 82.7%; Score 91; DB 19; Length 198; 94.7%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A cDNA clone (AAT16336) derived from human kidney codes for a 27 kDa protein, p27 Kipl (AAR92709), that is capable of binding to and inhibiting the activation of a cyclin E-CdR2 complex. Human Kipl shows a high degree of homology to mink (AAR92707) and mouse (AAR92708) Kipl proteins, and the N-terminal half of the protein shows significant homology to Cipl/WART. Kipl shows cdk inhibitory activity and prevents cdk2 activation. Overexpression inhibits cell entry to the S phase. Kipl can be produced by expression of the CDNA clone in cultured cells. It can be used in in vitro assays to screen agents that affect p27 activity, and in methods for the diagnosis and treatment of hypoproliferative disorders, e.g. cancer and

This sequence is the cyclin kinase inhibitor (CKI) protein p27. The invention relates to a method for diagnosing a hyperproliferative disorder, associated with the destabilisation of a CKI protein in cells of a patient, comprises: (i) ascertaining the CKI protein level in a sample of patient cells; and (ii) diagnosing the presence or absence of a hyperproliferative disorder by utilising the ascertained CKI protein level, relative to a normal control level, where a reduced CKI protein level, relative to a normal control cell sample, correlates with the presence of a hyperproliferative disorder. The methods are useful for diagnosing disorders associated with hyperproliferation, evaluating their aggressiveness and/or rate of recurrence and as prognosis for evaluating a cancer patient's risk of death and/or recurrence of the cancer. The city of death and/or recurrence of the cancer. The city diagnostic methods may also be employed as follow-up to treatment, e.g. quantitation of the level of p27 protein may be indicative of the effect of these therapies upon patient prognosis. The methods and reagents allow the detection of loss of p27 protein from a cell in order the content of prognosis of the patient prognosis. The methods and reagents allow the detection of loss of p27 protein from a cell in order the content of prognosis. The methods and the order of the patient prognosis. The methods and the order of the patient prognosis. The methods and the order of the patient prognosis. The method of the them the patient prognosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        tumourigenic transformation of cells, or other hyperplastic or neoplastic transformation processes as well as differentiative disorders such as degeneration of tissue e.g. neurodegeneration.
                                                                                                                                                                                                                                                               Methods for diagnosis and prognosis of hyperproliferative disorders - by determining the level of cyclin kinase inhibitor protein(s), particularly p27
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; chimeric cyclin dependent kinase inhibitor; CDKi; therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a p27KIP1 protein, which is part of a family of small cyclin-dependent kinase inhibitors. The proliferative state of a cell transformed with Human papillomavirus (HPV) can be evaluated in the following manner. Cyclin/cyclin-dependent kinase complexes containing protein p27KIP1 are isolated from the transformed cell, and the HPV E7 oncoprotein (AAW46868) added to the isolated protein. Cyclin/cyclin-dependent kinase complexes are isolated from an untransformed cell that is substantially homogenic with the transformed cell, and the HPV E7 oncoprotein added. The kinase activities of the 2 samples are measured, where a proliferating transformed cell has a greater kinase activity that the untransformed cell. The method is sused for determining the extent of interaction and/or inactivation between a cyclin/cyclin-dependent kinase inhibitor and the HPV E7 oncoprotein and thus evaluating the proliferative state of a transformed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Evaluation of proliferative state of cells transformed with human papilloma virus - by determining cyclin-dependent kinase activity induced by E7 onco-protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The present sequence is that of human p27, a cyclin dependent kinase inhibitor (CDKi) that inhibits smooth muscle cell proliferation. A claimed method for inhibiting smooth muscle cell proliferation involves transducing smooth muscle cell with a replication-deficient recombinant adenovirus that lacks a functional El region and a functional El region, and comprises a transgene encoding a CDKi. The CDKi is selected from an INK4 family protein such as human p16, a CIP/KIP family protein such as p27, active fragments of these, or fusion proteins comprising (active fragments of an ANY96049). The method is used to inhibit mammalian smooth muscle cell hyperproliferation induced by injury caused by angioplasty, stent placement or vein engraftment. It is useful for treating trunses encoding CDKis.
                                                                                                                                                                                                                                                                          Novel recombinant lentivirus for inhibiting proliferation of smooth muscle cells in e.g. restenosis, is replication deficient and comprises a transgene encoding a cyclin dependent kinase inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Cyclin dependent kinase inhibitor; CDK1; CIP; KIP; human; p27; angiogenesis; inhibitor; neoplasia; rheumatoid arthritis; endometriosis; psoriasis; vascular retinopathy; cytostatic; antiarthritic; antirheumatic; gynaecological; antipsoriatic; antiproliferative; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents the human p27 protein.

The invention relates to a protein composition comprising a novel purified chimeric cyclin dependent kinase inhibitor (CDKI) and a purified adenovirus E4 protein. The compositions comprising the protein, or the DNA encoding it are useful for treating neoplasias in animals. The compositions also find use in assays to eliminate a specific sub-population of cultured cells, to determine the susceptibility of neoplastic cells to treatment with the compositions and also in assays to synchronise cell growth in cultured cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present protein sequence is a mutant cyclin-dependent kinase inhibitor (CKI), p27. It is bound by hKIS, a sering-threenine kinase, that inhibits its ability to arrest cells in GI phase. A substitution mutation (AGC to GGT) results in a serine to alanine (SIGA) change in the protein, that abolishes phosphorylation of GST-p27, without affecting in vitro binding with hKIS. Endogenous p27 was detected in the cytoplasm and at higher levels in the nucleus. hKIS functions as an inhibitory kinase of CKI p27. The hKIS sequences are used to modulate cell proliferation and scallar diseases. The polynucleotide sequence may be used in gene therapy to treat vascular disorders such as restenosis or atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          p27(Kip1) kinase inhibitor protein; FKBP-12; p27(Kip1).FKBP-12 complex; cytosolic drug-binding protein; yeast two hybrid assay system; cell differentiation; apoptosis; neurodegeneration; tumorigenicity; cell prolliferation related disorder; atherosclerosis; autoimmune disease; transplant rejection; inflammation; allergy; cancer; viral infection; membranous nephropathy; CDK; cyclin-dependent kinase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NAME OF COLOR OF A PART OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is that of human p27, a cyclin dependent kinase inhibitor (CDK1) that inhibits angiogenesis. A claimed method for inhibiting angiogenesis involves transducing an epithelial cell with a transgene encoding (internalizable, secretable) CDK1. The delivery system for the transgene may be a lipsoame or a recombinant virus. The CDK1 is preferably a protein of the CIP/KIP family such as p27, a protein of the INK4 family cuch as p16, active fragments of these proteins (e.g. amino acids such as p27 and p16 (see AAY960800). The method is useful in treating conditions associated with angiogenesis, e.g. neoplasia, rheumatoid cultinitis, endometriosis, psoriasis and vascular retinopathy cultinitation and is expressed by that cell such that the CDK1 is released into the blood and contacts the target epithelial cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human mutant cyclin-dependent kinase inhibitor (CKI), p27 S10A protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cyclin-dependent kinase inhibitor; CKI; p27; human; mutant; Gl phase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                           The present sequence is p27(Kipl) kinase inhibitor protein. This protein activity by inhibiting cyclin-CDK complex-associated kinase activity. Interaction between p27(Kipl) and FKBP-12 (a cytosolic drug-binding protein) to form a p27(Kipl). FKBP-12 complex was detected using a modified yeast two hybrid assay system. This interaction is used in regulating many cell functions, e.g. cell cycle progression, differentiation, apoptosis, neurodegeneration, response to viral infection, tumorigenicity, p27(Kipl). FKBP-12 complex and its corresponding nucleic acid sequence is used in diagnosis and treatment of cell proliferation related disorders. Specified diseases are atherosclerosis; autoimmune diseases (e.g. transplant rejection, inflammation or allergy); neurodegeneration; cancer; membranous nephropathy and viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                      New complex of p27(kip1) and FKBP-1, for treatment, prevention and dlagnosis of, e.g. cancer and autoimmune disease -

                                                                The present sequence represents a human p27 KIP1 polypeptide. The specification describes a knockout mouse whose genome is manipulated to comprise a homozygous disruption of both the p19 INK4d and p27 KIP1 genes, where homozygous disruption of these genes results in the knockout mouse exhibiting bradykinesia and/or proprioceptive abnormalities, or prevents in the expression of functional p19 INK4d and p27 KIP1 proteins. The knockout mouse and cells may be used to identify potential modulator of cell growth and more particularly neuronal growth. The knockout mouse is useful as animal model for studying motor disorders having symptoms that include bradykinesia and/or proprioceptive abnormalities and/or selzures, and in identifying potential modulators of motor functions. Cells from the knockout mouse may be used as a potential source of differentiated neuronal cells, and for identifying
